Executive Summary

“Autism. One World for All” Program – Key Strategic Takeaways

The Bulat Utemuratov Foundation has built a strong reputation as a driver of systemic social change in Kazakhstan through long-term, large-scale initiatives. The flagship program “**Autism. One World for All**” exemplifies this approach by addressing a critical gap in autism spectrum disorder (ASD) support through evidence-based intervention, national coverage, and institutional sustainability.

Launched in 2015 with an investment of **USD 15 million**, the program established a nationwide network of **13 Asyl Miras autism centers in 12 regions**, providing free access to diagnosis and intervention. To date, around **25,000 children** have been enrolled, with **over 17,000 children** receiving structured support, covering approximately **80% of diagnosed ASD cases** within the program’s scope. The use of internationally recognized methodologies (ABA, JASPER, ESDM), standardized diagnostics, and continuous progress monitoring ensures credibility, measurable outcomes, and alignment with global best practices.

A key strategic strength of the program is its **systemic orientation**. The transfer of **11 centers to state management** significantly enhances long-term sustainability and positions the program as part of national healthcare and education infrastructure rather than a standalone philanthropic initiative. At the same time, this model introduces challenges related to **quality consistency across regions** and increasing demand that may exceed current capacity.

The analysis identifies two major strategic gaps. First, program outcomes are partially dependent on **parental engagement outside the centers**, which varies and affects consistency of results. Second, there is a clear **lack of structured support for individuals with ASD after the age of 18**, despite ongoing needs related to independence, employment, and social inclusion.

To address these challenges, the report recommends protecting quality at scale through digital tools and standardized monitoring, while strategically expanding impact beyond childhood. In particular, a **partner-based inclusive employment model for adults with ASD (18+)** is proposed, leveraging cross-sector partnerships and the Foundation’s existing institutional strengths. This approach allows the Foundation to extend its leadership role from early intervention toward a **lifelong, sustainable autism support ecosystem** in Kazakhstan.

1. Organizational Analysis

1.1 Background and Role of the Foundation

The Bulat Utemuratov Foundation is a private charitable organization established in 2014 with the overarching aim of improving quality of life and contributing to sustainable social development in Kazakhstan. Since its inception, the Foundation has positioned itself as a key actor in addressing complex social challenges through large-scale, long-term initiatives rather than short-term or fragmented charitable actions.

The Foundation operates across several strategic areas, including healthcare, education, culture, sports, and social infrastructure. Its broad portfolio allows it to address social needs holistically, recognizing the interconnection between physical health, education, cultural development, and social inclusion. The total value of the Foundation's implemented and ongoing projects exceeds USD 240 million, reflecting both its financial capacity and its commitment to long-term impact.

A defining feature of the Foundation's approach is its emphasis on systemic change. Projects are designed not only to provide immediate support to beneficiaries but also to strengthen institutional capacity, develop infrastructure, and support public systems. This approach enables the Foundation to contribute to sustainable development outcomes and reduces dependency on continuous private funding in the long run.

1.2 Mission, Vision, and Values

The mission of the Bulat Utemuratov Foundation is to bring together people, ideas, and resources to create valuable and sustainable solutions that move society forward. This mission highlights the Foundation's role as a connector and catalyst, mobilizing financial, intellectual, and human capital to address social challenges in a structured and effective manner.

The Foundation's long-term vision is centered on sustainable social development in Kazakhstan. Rather than focusing exclusively on individual beneficiaries, the Foundation aims to create conditions in which public institutions, communities, and professionals are better equipped to respond to social needs independently. This vision is particularly evident in projects that involve the construction of social infrastructure, development of educational institutions, and transfer of operational responsibility to the state.

The Foundation's activities are guided by five core values:

- Effectiveness, reflected in the prioritization of measurable results, evidence-based approaches, and efficient use of resources;
- Care, demonstrated through a focus on vulnerable populations and socially sensitive areas such as healthcare and inclusive education;
- Trust, built through transparency, accountability, and long-term partnerships with beneficiaries, public institutions, and other stakeholders;
- Responsibility, emphasizing careful oversight of financial resources and ethical management of projects;
- Openness, expressed through continuous learning, collaboration, and openness to innovation and new ideas.
- These values are embedded in decision-making processes and influence how projects are selected, designed, implemented, and evaluated.

1.3 Governance and Organizational Structure

The Foundation was established by Bulat Utemuratov, a prominent entrepreneur and philanthropist whose business activities span multiple sectors, including finance, telecommunications, hospitality, real estate, and natural resources. His long-term engagement as founder provides the Foundation with strategic stability, financial continuity, and a clear vision for social impact.

Strategic oversight of the Foundation's activities is provided by the Board of Trustees. The Board includes respected representatives from diverse professional fields such as medicine, culture, public policy, sports, and media. This diversity contributes to balanced strategic decision-making and enhances the Foundation's legitimacy and public trust. The Board plays a key role in defining strategic priorities, approving major initiatives, and ensuring alignment with the Foundation's mission and values.

Operational management is carried out by an executive team led by the Chief Executive Officer. The management structure includes dedicated leadership roles in finance, human resources, research and development, and international cooperation. This functional specialization allows the Foundation to manage complex projects efficiently and maintain high standards of professionalism.

In addition, the Foundation has established specialized units, such as Resource Centers, to support the implementation of specific programs. These units provide methodological guidance, coordination, and quality assurance, ensuring consistency and effectiveness across different regions and projects. This organizational structure enables the Foundation to design, implement, scale, and, when appropriate, transfer projects to public authorities.

1.4 Target Groups and Beneficiaries

The Foundation's activities address a wide range of target groups, reflecting its multi-level approach to social impact. At the individual level, the Foundation supports vulnerable populations, including children with special needs, students, young people, and families requiring social assistance.

In the context of healthcare initiatives, the primary beneficiaries are children with autism spectrum disorder (ASD) and their families. These groups receive direct support through diagnostic services, intervention programs, and parental guidance. Families play a critical role in the effectiveness of interventions, and the Foundation actively involves parents in its programs.

At the professional level, the Foundation targets specialists working in healthcare, education, and social services. Through training, certification, and access to evidence-based methodologies, the Foundation contributes to capacity building and professional development.

At the systemic level, public institutions such as schools, healthcare facilities, universities, and local authorities benefit from the Foundation's investments in infrastructure, knowledge transfer, and institutional development. This multi-tiered beneficiary model allows the Foundation to create both immediate and long-term impact.

1.5 Main Program: “Autism. One World for All”

One of the Foundation's flagship healthcare initiatives is the program “Autism. One World for All,” launched in 2015. The program was developed in response to the increasing prevalence of autism spectrum disorder and the limited availability of accessible, evidence-based support services in Kazakhstan at the time.

The Foundation allocated USD 15 million to the development and implementation of the program, reflecting its strategic importance. The primary goal of the program is to build a sustainable, evidence-based support system for children with ASD and their families, ensuring early diagnosis, effective intervention, and long-term inclusion.

The program is grounded in internationally recognized methodologies, including Applied Behavior Analysis (ABA) and JASPER. These approaches are implemented through individualized intervention plans tailored to each child's needs. A key principle of the program is the active involvement of parents, who receive training and guidance to support their children beyond the center-based sessions.

1.6 Program Structure, Activities, and Scale

As part of the “Autism. One World for All” program, a network of 13 Asyl Miras autism centers has been established across 12 regions of Kazakhstan. The centers operate according to unified methodological standards and provide services free of charge, ensuring equal access for families regardless of socio-economic background.

The activities of the centers include diagnostic assessment, development of individualized intervention plans, continuous monitoring of progress, specialist supervision, and parental training. Progress is assessed using structured tools and regular evaluations, allowing for data-driven adjustments to intervention strategies.

Since its launch, approximately 25,000 children have been enrolled in the Asyl Miras system, and more than 17,000 children have participated in intervention programs. According to internal data, around 80% of children with confirmed ASD have received structured intervention support. These figures demonstrate the significant scale and reach of the program.

In addition to direct service provision, the program places strong emphasis on public awareness and advocacy. Awareness campaigns, educational events, and cooperation with media contribute to reducing stigma and promoting inclusive attitudes toward people with ASD.

1.7 Contribution to Systemic Change

Beyond individual outcomes, the “Autism. One World for All” program contributes to systemic change in Kazakhstan’s healthcare and education sectors. By training specialists, developing unified methodologies, and transferring centers to state management, the Foundation supports the integration of evidence-based ASD services into public systems.

This approach aligns with the Foundation’s broader strategy of sustainability and institutional development. Rather than remaining solely a service provider, the Foundation acts as a catalyst for long-term change, enabling public institutions to continue delivering support independently.

2. Analysis of the Environment

2.1 PEST Analysis

Political & Legal Factors:

The “Autism. One World for All” program operates in a system where autism support is largely defined by the public sector. Access to diagnosis, early intervention, school inclusion, and long-term

rehabilitation depends on national policies, but in practice it is heavily shaped by how regions implement these rules and how well institutions cooperate.

A key structural factor is the program's institutionalization: **11 out of 13 autism centers were transferred to the state**. This move supports long-term sustainability and reduces dependence on continuous philanthropic funding. At the same time, it creates a clear governance challenge: once centers are managed under different regional conditions, it becomes harder to ensure the same standards of quality everywhere. According to the collected materials, **maintaining unified quality standards in state-operated centers remains a key challenge**.

So, politically and legally, the environment supports scaling - but the success of scaling depends on keeping service quality consistent after transfer.

2.2 Economic Factors

From an economic perspective, the program directly addresses an affordability gap. Comparable autism intervention services on the private market can cost **around 15,000–25,000 KZT per hour**, making consistent support inaccessible for many families.

This makes the program's **free access** more than a social benefit - it is the main reason the program can reach families at scale, prevent financial exclusion, and create equal access across income groups. In economic terms, this positions the program as a system-level solution rather than a niche service available only to those who can pay.

2.3 Social Factors

Socially, demand for autism support continues to grow. According to WHO estimates, autism affects a significant share of the population globally (approximately 1 in 127 people), underlining that the need for support is widespread rather than marginal.

In Kazakhstan, the exact numbers differ depending on registration and definitions, yet the available data points in the same direction: need is increasing and pressure on the support system is rising. As a result, the program experiences **high demand and waiting lists**, which also acts as an indirect indicator of trust and perceived quality.

At the same time, autism support is not only medical. It also affects inclusion, family well-being, and long-term independence. Therefore, the program's impact goes beyond therapy sessions - it shapes public awareness, acceptance, and long-term social outcomes.

2.4 Technological Factors

Technologically, the program has a strong foundation because it relies on structured evaluation and measurable progress tracking. The materials confirm the use of **ADOS-2**, individual development plans, and data monitoring through charts and electronic systems.

This approach creates an opportunity to scale more effectively through digital tools. The next logical step is not just “digitalization” in general, but practical standardization across regions through:

- unified data systems and reporting formats,
- remote quality audits and performance monitoring,
- scalable specialist training and certification support,
- and digital tools that help parents apply intervention methods consistently at home.

Overall, the environment is favorable because demand is high and the program has strong legitimacy. The main risk is scaling capacity and coverage without losing quality consistency across regions.

2.5 Key Stakeholders

The program operates within a multi-stakeholder system where outcomes depend on several groups, not just the centers themselves.

Children with ASD are the main beneficiaries, and the program’s value is built around early support, structured intervention, and measurable progress.

Parents and families are a critical stakeholder group because intervention effectiveness depends heavily on what happens outside the centers. The materials highlight that while parent involvement is generally high, home engagement varies, and this matters because **center sessions (2 times per week, 1 hour each) are not sufficient without continued practice at home.**

This creates a strategic constraint: even high-quality center support can produce weaker outcomes if families lack time, confidence, or resources to reinforce skills consistently.

Specialists (therapists, psychologists, educators) are the program’s core operational resource. Their involvement is described as highly committed, and they directly determine service capacity and quality.

At the same time, specialists are difficult to scale quickly because training and certification require time and investment.

The Resource Center plays a unique system role. It provides methodological support, specialist training, and quality standardization. It was created in **2022** and includes a leadership structure with **5 trainers/experts**, which strengthens the program's ability to scale while protecting consistency across regions.

Finally, **government institutions and partners** shape long-term sustainability, coordination, and integration into healthcare, education, and social support systems. They are essential for making the program not only effective as a service, but resilient as a national infrastructure.

3. Analysis of the Strategy

3.1 SWOT Analysis. Strengths

The program's strongest advantage is its **evidence-based approach**, using internationally recognized models such as **ABA, JASPER, and ESDM**, with structured assessment and measurable monitoring of progress.

Second, the program has achieved **national scale** through **13 centers**, and the transfer of most centers to the state makes this infrastructure more sustainable over the long term.

Third, **free access** eliminates the cost barrier and allows the program to serve families who otherwise could not afford private intervention.

3.2 Weaknesses

The main internal limitation is the risk of **inconsistent quality across regions**. When centers operate under different local staffing, management, and institutional conditions, maintaining unified standards becomes more difficult.

Another weakness is the program's partial dependence on **parental involvement outside the center**. Even when families are motivated, the level of engagement at home varies - and because center sessions are limited in time, variation at home can reduce the consistency of outcomes.

3.3 Opportunities

A key opportunity is expanding the support pathway beyond childhood. The materials emphasize a major systemic gap: support often decreases significantly after **age 18**, while needs related to independence, employment, and social adaptation remain.

Another opportunity is strategic digital scaling, including unified monitoring systems, remote training, and tools that help reduce regional differences in quality delivery. The Foundation also already has early steps toward this direction (e.g., partnerships and structured training initiatives).

3.4 Threats

One major threat is weak cross-sector coordination: healthcare, education, and social support systems often operate separately, which reduces continuity of care and long-term outcomes.

Another threat is demand growth exceeding current capacity, increasing the risk of waiting lists, specialist overload, and service quality pressure.

A further threat is the spread of misinformation and non-evidence-based practices in the public space, which can reduce trust and lead families to ineffective decisions.

3.5 Sources of Competitive Advantage

The program's competitive advantage is built not only on "good intentions," but on capabilities and infrastructure that are difficult to replicate.

First, the program combines **evidence-based intervention models** with **measurable progress tracking**, supporting credibility, accountability, and continuous improvement.

Second, it has achieved a rare level of **national scale**, supported by institutional integration through state transfer, which increases resilience compared to standard NGO projects.

Third, **free access** enables high reach and social equity, ensuring that support is not limited to a small group of high-income families.

Finally, the **Resource Center** strengthens long-term sustainability by training specialists, supporting methodology, and protecting consistent standards - which becomes especially important in a system where many centers operate under different regional conditions.

4. Key Challenges of the Program

The "Autism. One World for All" program faces several systemic challenges that hinder its overall effectiveness and scalability. These challenges are not the result of operational errors but are rather inherent issues in social programs addressing complex needs like autism support. Addressing these issues is critical to enhancing the program's efficiency, reach, and long-term sustainability.

One of the main challenges is the limited support available for individuals with Autism Spectrum Disorder (ASD) once they reach adulthood. Existing programs predominantly focus on children, and as individuals with ASD transition into adulthood, they face a significant gap in available services. This lack of support after the age of 18 leaves many individuals without the necessary resources to live independently and successfully integrate into society.

Another significant issue is the high dependency on parental involvement. The program's success often relies heavily on the engagement of parents, and while this can be beneficial in certain cases, it creates variability in outcomes. Families with higher levels of involvement tend to see better results, but for those with less engagement, the program's impact is diminished. This inconsistency limits the program's overall effectiveness.

Additionally, the program is facing capacity constraints, particularly with the workload of specialists. The demand for autism support services has grown substantially, but the number of trained professionals has not kept pace with this increase. This discrepancy leads to high workloads for the available specialists, which affects the quality and consistency of care provided to families. Specialists are often stretched thin, making it difficult to manage the growing caseload and provide the personalized care each family requires.

The growing demand for autism support services also exceeds the program's current capacity. This mismatch between demand and available resources has led to long waiting lists, further delaying the provision of necessary assistance. The inability to meet the increasing demand restricts the program's ability to provide timely support to all families in need.

Lastly, the program operates within a fragmented system that lacks adequate coordination with public institutions. Support for individuals with autism is dispersed across various sectors, including healthcare, education, and social services, which makes it difficult to ensure continuity of care. A more integrated and coordinated approach is needed to enhance the program's ability to provide comprehensive and consistent support.

4.1 Problem Analysis Using Frameworks

In order to analyze the challenges in greater depth, several frameworks were applied to provide a clearer understanding of the underlying issues affecting the program's success.

From a **systems perspective**, the program operates in a fragmented environment where support for individuals with ASD is divided among different institutions. This fragmentation creates barriers to effective communication and collaboration, which hampers the delivery of continuous and holistic

care. The lack of integration between systems leads to inefficiencies and service gaps, preventing the program from providing a seamless experience for families.

The **resource-based view** highlights the central role of human resources in the program's success. The program's ability to provide high-quality support relies heavily on the availability and expertise of specialists. However, the growing demand for services and the limited number of trained professionals create a bottleneck that prevents the program from scaling effectively. The scarcity of qualified specialists limits the program's capacity to meet the increasing needs of families and offer timely, high-quality care.

From a **stakeholder perspective**, the effectiveness of the program is influenced not only by the specialists and centers but also by the level of parental involvement. Parental engagement is critical for reinforcing the skills learned at the centers, but the degree of involvement varies significantly between families. This variation creates disparities in the program's impact, as some families are highly engaged while others may struggle to participate fully. The overall success of the program is thus dependent on consistent and adequate parental involvement.

This comprehensive analysis of the program's challenges sets the stage for the strategic recommendations that will be explored in subsequent sections. Understanding these systemic issues is essential for developing targeted solutions that will improve the program's effectiveness, scalability, and sustainability.

5. Inspiration and Benchmarking

5.1 NGOs and Social Enterprises

A key strategic challenge identified within the program is the limited support available for individuals with autism spectrum disorder (ASD) after the age of 18. To address this issue, global best practices from non-governmental organizations and social enterprises were analyzed.

Organizations such as **Specialisterne** (Denmark) and **Auticon** (operating globally) represent leading models in autism-inclusive employment. These enterprises are built on a strengths-based approach, reframing autism not as a limitation but as a source of unique capabilities. Individuals with ASD are engaged in high-value roles, particularly in information technology, software testing, and data analysis, where skills such as sustained concentration, attention to detail, and pattern recognition provide a competitive advantage.

Application to the Program: The Bulat Utemuratov Foundation has the opportunity to adapt this model by expanding its existing **MINOR program** in partnership with **Narxoz University**. The creation of a dedicated **Career Hub** would bridge the gap between education and employment, providing structured pathways to independence for young adults with ASD. This initiative would directly address the post-18 support gap while aligning with international best practices in social enterprise development.

5.2 Neurodiversity Hiring Programs: Corporate Sector Benchmarking

In the corporate sector, companies such as **SAP, Microsoft, and JPMorgan Chase** have pioneered neurodiversity hiring programs that fundamentally redesign traditional recruitment processes. These organizations have recognized that standard interviews, which rely heavily on social interaction and abstract communication, often exclude talented candidates with ASD.

Instead, these companies employ **skills-based assessments**, practical tasks, and extended evaluation periods that allow candidates to demonstrate their competencies in real-world scenarios. This shift has resulted not only in improved inclusion but also in measurable business outcomes, including higher productivity, innovation, and employee retention.

Application to the Program: The Foundation is well positioned to act as an **expert consultant** for the business sector in Kazakhstan. By sharing its evidence-based methodologies and practical experience, the Foundation can support local companies in creating “**Special Friendly**” workplaces. This approach extends the Foundation’s impact beyond direct service provision and contributes to solving the systemic challenge of adult social adaptation at a national level.

5.3 Focus on Technological Advancement: AI and Digital Solutions

As demand for autism support continues to grow, digitalization and technological innovation become essential for scalability and quality assurance. In the health technology sector, companies such as **Cognoa** (USA) demonstrate how artificial intelligence can be used to analyze behavioral data, including short home videos, to support early diagnosis and monitor developmental progress.

Project Insight: Building on this benchmark, the report proposes the development of a **mobile application for parents** participating in the program. Through this application, parents would record short videos of home-based activities. An AI algorithm, trained and supervised by the Foundation’s Resource Center, would provide immediate, practical feedback. Examples include confirming correct

application of ABA techniques or suggesting improvements in interaction, such as reinforcing eye contact.

This solution directly addresses one of the program's key weaknesses: high dependence on parental involvement outside the centers. By empowering parents with real-time guidance, the program can improve consistency, engagement, and overall outcomes without significantly increasing the workload of specialists.

5.4 Business Benchmarking: Game Mechanics and Behavioral Motivation (Duolingo)

Sustained parental engagement is critical for the success of autism intervention programs. To address motivation over the long term, this report benchmarks **Duolingo**, a global leader in educational technology, known for its effective use of gamification.

Duolingo applies micro-learning principles, daily goals, and "streaks" to encourage habit formation and consistent user engagement. These mechanisms transform learning into a structured, rewarding process.

Application to the Program: The program can adopt similar **game mechanics** for parents. For example, parents could earn points for completing home assignments, submitting skill generalization reports, or maintaining consistent engagement over time. Accumulated points could be exchanged for tangible benefits, such as additional consultations, priority access to specialists, or participation in international forums and training events.

By making parental involvement visible, measurable, and rewarding, gamification supports long-term commitment and reinforces the program's inclusive philosophy that meaningful change is built through daily effort.

5.5 Strategic Value and Long-Term Impact

The benchmarking insights presented in this report demonstrate the future development of "Autism. One World for All" program lies at the intersection of **social innovation, corporate collaboration, and digital transformation**. Integrating international best practices in employment, leveraging AI-driven tools, and applying motivational design principles can significantly strengthen the program's sustainability and systemic impact.

Most importantly, these recommendations reinforce the program's core mission: to ensure that individuals with autism are supported not only in childhood, but throughout their lives, with dignity,

opportunity, and inclusion. In this way, the principle that “*The world is one for everyone*” is translated from a vision into everyday practice.

6. Strategic Recommendations

6.1 Strategic Recommendation: Inclusive Partner-Based Employment Model for Adults with ASD (18+)

This recommendation proposes the creation of a **long-term partnership-based employment model** that integrates **adults with Autism Spectrum Disorder (ASD) aged 18+** into selected **sports organizations and businesses** through **simple, structured work activities** supported by professionals from the *Asyl Miras* program.

The core idea is to build a **network of partner organizations** - including **tennis clubs, golf clubs, cafés, restaurants, retail stores, and warehouses** - where adults with ASD can perform **predictable, low-complexity tasks** that do not require high cognitive load, but still provide **meaningful social participation and income opportunities**.

A key enabler of this recommendation is the unique institutional position of the Foundation’s founder, **Bulat Utemuratov**, who is the **President of the Kazakhstan Tennis Federation** and **Vice-President and Board Member of the International Tennis Federation**. These roles significantly reduce entry barriers for partnerships with **tennis clubs and sports organizations**, making sport-based pilots especially realistic as a starting point. At the same time, the model is intentionally designed to be **scalable beyond tennis** to other sectors.

Operational model:

The recommendation can be implemented through three complementary formats:

1. Event-based participation (2–3 times per month)

Short, supervised visits to partner locations:

- Tennis and golf clubs: collecting balls, preparing equipment, basic court or field setup
- Retail and warehouses: light sorting, labeling, simple packaging
- Cafés and restaurants: dishwashing, basic cleaning, food preparation support

2. Regular micro-shifts (1–2 times per week)

Short work shifts (1–2 hours) in a fixed location, offering greater routine and stability.

3. Transitional pathway (3–6 months)

A structured pathway from training → trial shifts → stable placement or internship.

Roles and responsibilities

- **Asyl Miras / Resource Center**
 - Participant selection and preparation
 - Task adaptation and safety standards
 - Ongoing supervision and progress monitoring
- **Partner organizations**
 - Safe and inclusive work environment
 - Designated workplace supervisor (“buddy”)
 - Clear task structure and predictable routine
- **Public institutions (where applicable)**
 - Support with legal frameworks, employment regulations, and social benefits

This model directly addresses the **post-18 support gap**, creates **real-world inclusion**, and strengthens **systemic cooperation** between the Foundation, business sector, and public institutions.

6.2 Analysis of Advantages and Potential Risks

Advantages:

Social inclusion and independence

The model enables adults with ASD to participate in everyday social environments such as sports clubs and cafés, supporting social interaction, routine-building, and increased independence.

Employment and income opportunities

Participants may receive small compensations or tips, which contributes to basic financial independence and self-esteem.

Awareness and stigma reduction

Placing adults with ASD in **visible and respected environments** (e.g., sports clubs, especially tennis and golf) increases public awareness and normalizes inclusion, particularly among influential and affluent audiences.

Sustainability through partnerships

By embedding inclusion into existing organizations, the program reduces reliance on stand-alone funding and builds long-term, mutually beneficial relationships.

Potential Risks:

Need for continuous professional support

Without proper supervision and task adaptation, there is a risk of stress or disengagement for participants.

Initial resistance from partner organizations

Some businesses may hesitate due to uncertainty, lack of experience, or perceived operational burden.

Inconsistent partner commitment

Long-term success depends on stable cooperation; partner engagement may fluctuate over time.

Risk mitigation measures

- Clear Partner Toolkit and task guidelines
- Pilot-based implementation before scaling
- Regular feedback loops with partners and families
- Gradual expansion of responsibilities based on individual readiness

6.3 Cost Estimation and Potential Sources of Funding

Cost estimation:

The recommendation involves **medium to high costs during the pilot phase**, primarily related to:

- Professional support staff and job coaches
- Program coordination and partner management
- Development of training materials and toolkits
- Basic communication and awareness activities

Costs are expected to decrease per participant once the model is standardized and scaled.

Potential sources of funding:

Corporate sponsorships

- Sports brands and organizations associated with tennis and golf
- Companies with strong CSR and ESG agendas

Business partnerships

- In-kind support from partner organizations (space, supervision, equipment)
- Co-branded social initiatives

Grants and public funding

- International and national grants focused on disability inclusion and employment
- Public programs supporting social integration and workforce inclusion

Community contributions

- Voluntary donations and tips from clients of partner organizations

6.4 Measuring Impact and Long-Term Sustainability

To ensure accountability and learning, the program should include **clear impact measurement indicators**, such as:

- Number of adults with ASD participating
- Retention rate and consistency of participation
- Skill development and task independence over time
- Partner satisfaction and continuity of cooperation
- Qualitative feedback from participants and families

Social media and digital communication can further support sustainability by:

- Sharing success stories and partnerships
- Increasing public awareness
- Attracting new partners and sponsors

6.5 Strategic Value for the Foundation

This recommendation aligns strongly with the Foundation's **mission, values, and long-term orientation**. It builds on existing strengths, leadership, and networks, while addressing a critical systemic gap in autism support.

By extending impact beyond childhood and embedding inclusion into real economic and social settings, the *Asyl Miras* program can strengthen its role as a **national model for sustainable autism support**.
